Probing freeze-in scalar dark matter through decay

Saturday 14 Sep 2019 at 09:00 (00h15')

Content :

We discuss a setup in which freeze-in scalar singlet dark matter production can be probed through dark matter decay.

If dark matter consists of two or more flavors of scalar singlets, transitions between dark matter particles can serve as a probe of the coupling that sets the relic abundance and give rise to gamma-ray spectral features.
