SCALARS-2017, Warsaw — December 02, 2017

# TWIN HIGGS MODEL

Chacko, Goh, Harnik: hep-ph/0506256

- ♦ Twin Higgs model is the first example of “Neutral Naturalness”, where the *Hierarchy Problem* is solved by SM neutral ‘top partner’.
- ♦ Twin Higgs model extends the SM by its “twin/mirror” copy.

$$SU(3) \times SU(2) \times U(1)$$

$$\widehat{SU}(3) \times \widehat{SU}(2) \times \widehat{U}(1)$$

- ♦ Mirror SM is related to the SM by a discrete  $\mathbb{Z}_2$  symmetry.

# TWIN HIGGS MODEL

Chacko, Goh, Harnik: hep-ph/0506256

- ♦ The SM Higgs doublet  $H$  and the twin Higgs doublet  $\hat{H}$  have an  $SU(4)$  global symmetry.

$$V(\mathbb{H}) = \lambda (\mathbb{H}^\dagger \mathbb{H} - f_0^2/2)^2 \quad \mathbb{H} = \begin{pmatrix} H \\ \hat{H} \end{pmatrix}$$

- ♦ Spontaneous symmetry breaking:

$$SU(4) \rightarrow SU(3) = 7 \text{ Goldstone bosons}$$

$$7 \text{ GBs} - 3 (W^\pm, Z) - 3 (\hat{W}^\pm, \hat{Z}) = 1 \text{ GB, the SM Higgs } h_0 + \text{the radial mode } \hat{h}_0$$

SM weak gauge bosons

Twin weak gauge bosons

# TWIN HIGGS MODEL

Chacko, Goh, Harnik: hep-ph/0506256

- ◆ Cancellation of quadratic divergences in the Twin Higgs models

$$\begin{aligned}
 & \text{Diagram 1: } h \text{ (dashed) } \rightarrow \text{top quark loop} \rightarrow h \text{ (dashed)} \\
 & \text{Diagram 2: } h \text{ (dashed) } \rightarrow \text{top partner loop} \rightarrow h \text{ (dashed)} \\
 & \text{Sum: } \sim \frac{y_t^2}{8\pi^2} N_c \Lambda^2 (|H|^2 + |\hat{H}|^2) \\
 & \sim \frac{y_t^2}{8\pi^2} N_c \Lambda^2 |\mathbb{H}|^2 \\
 & \text{Cancellation condition: } \hat{y}_t \simeq y_t \\
 & \text{Result: } SU(4) \text{ invariant} \\
 & \rightarrow m_{h_0} = 0
 \end{aligned}$$

- ◆ Note, since the 'top partners'  $\hat{t}$  are SM colorless, therefore, they are elusive at the LHC.

# TWIN HIGGS MODEL

Chacko, Goh, Harnik: hep-ph/0506256

- ◆ Cancellation of quadratic divergences in the Twin Higgs models

$$\begin{aligned}
 & \text{Diagram 1: } h \text{---} y_t \text{---} \text{top quark loop} \text{---} y_t \text{---} h \\
 & \text{Diagram 2: } h \text{---} y_t \text{---} \text{top partner loop} \text{---} y_t \text{---} h \\
 & \text{Diagram 2 also has a top partner line labeled } \hat{t} \text{ with coupling } \hat{y}_t f \text{ and } -\frac{\hat{y}_t}{2f} \\
 & \sim \frac{y_t^2}{8\pi^2} N_c \Lambda^2 (|H|^2 + |\hat{H}|^2) \\
 & \sim \frac{y_t^2}{8\pi^2} N_c \Lambda^2 |\mathbb{H}|^2 \\
 & \underline{\hat{y}_t \simeq y_t} \\
 & SU(4) \text{ invariant} \\
 & \rightarrow m_{h_0} = 0
 \end{aligned}$$

- ◆ Note, since the ‘top partners’  $\hat{t}$  are SM colorless, therefore, they are elusive at the LHC.

★ The SM Higgs mass is induced by the  $SU(4)$  and  $\mathbb{Z}_2$  explicit symmetry breaking terms.

# TWIN HIGGS MODEL

◆ Twin Higgs effective potential

see e.g. *Craig, Katz, Strassler, Sundrum: 1501.05310*  
*Katz, Mariotti, Pokorski, Redigolo, Ziegler: 1611.08615*

$$V_{\text{eff}}(H, \hat{H}) = \lambda \left( |H|^2 + |\hat{H}|^2 - \frac{f_0^2}{2} \right)^2 + \kappa (|H|^4 + |\hat{H}|^4) - \sigma f_0^2 |H|^2 + \rho |H|^4$$

$$H = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + h_0 \end{pmatrix}, \quad \hat{H} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ \hat{v} + \hat{h}_0 \end{pmatrix}$$

# TWIN HIGGS MODEL

♦ Twin Higgs effective potential

$$V_{\text{eff}}(H, \hat{H}) = \lambda \underbrace{\left( |H|^2 + |\hat{H}|^2 - \frac{f_0^2}{2} \right)^2}_{\text{Invariant under } \mathbb{Z}_2 \text{ and } SU(4) \text{ symmetries, and source of spontaneous symmetry breaking.}} + \kappa (|H|^4 + |\hat{H}|^4) - \sigma f_0^2 |H|^2 + \rho |H|^4$$

Invariant under  $\mathbb{Z}_2$  and  $SU(4)$  symmetries, and source of spontaneous symmetry breaking.

$$H = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + h_0 \end{pmatrix}, \quad \hat{H} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ \hat{v} + \hat{h}_0 \end{pmatrix}$$

# TWIN HIGGS MODEL

◆ Twin Higgs effective potential

$$V_{\text{eff}}(H, \hat{H}) = \underbrace{\lambda \left( |H|^2 + |\hat{H}|^2 - \frac{f_0^2}{2} \right)^2}_{\text{Invariant under } \mathbb{Z}_2 \text{ and } SU(4) \text{ symmetries, and sources the spontaneous symmetry breaking.}} + \underbrace{\kappa (|H|^4 + |\hat{H}|^4)}_{\text{Invariant under } \mathbb{Z}_2 \text{ but breaks } SU(4) \text{ symmetry explicitly. This generates SM Higgs VEV,}} - \sigma f_0^2 |H|^2 + \rho |H|^4$$

Invariant under  $\mathbb{Z}_2$  and  $SU(4)$  symmetries, and sources the spontaneous symmetry breaking.

Invariant under  $\mathbb{Z}_2$  but breaks  $SU(4)$  symmetry explicitly.  
This generates SM Higgs VEV,  
$$v = \hat{v} = \frac{f_0}{\sqrt{(2\lambda + \kappa)}}$$

$$H = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + h_0 \end{pmatrix}, \quad \hat{H} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ \hat{v} + \hat{h}_0 \end{pmatrix}$$

# TWIN HIGGS MODEL

## ♦ Twin Higgs effective potential

$$V_{\text{eff}}(H, \hat{H}) = \underbrace{\lambda \left( |H|^2 + |\hat{H}|^2 - \frac{f_0^2}{2} \right)^2}_{\text{Invariant under } \mathbb{Z}_2 \text{ and } SU(4)} + \underbrace{\kappa (|H|^4 + |\hat{H}|^4)}_{\text{Invariant under } \mathbb{Z}_2 \text{ but breaks } SU(4)} - \underbrace{\sigma f_0^2 |H|^2 + \rho |H|^4}_{\text{Softly breaks both } \mathbb{Z}_2 / SU(4)}$$

Invariant under  $\mathbb{Z}_2$  and  $SU(4)$  symmetries, and sources the spontaneous symmetry breaking.

Invariant under  $\mathbb{Z}_2$  but breaks  $SU(4)$  symmetry explicitly. This generates SM Higgs VEV,  

$$v = \hat{v} = \frac{f_0}{\sqrt{(2\lambda + \kappa)}}$$

Softly breaks both  $\mathbb{Z}_2 / SU(4)$  symmetries. It generates misalignment in the two VEVs  

$$v \ll \hat{v}$$

$$H = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + h_0 \end{pmatrix}, \quad \hat{H} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ \hat{v} + \hat{h}_0 \end{pmatrix}$$

# TWIN HIGGS MODEL

## ◆ Twin Higgs effective potential

$$V_{\text{eff}}(H, \hat{H}) = \underbrace{\lambda \left( |H|^2 + |\hat{H}|^2 - \frac{f_0^2}{2} \right)^2}_{\text{Invariant under } \mathbb{Z}_2 \text{ and } SU(4)} + \underbrace{\kappa (|H|^4 + |\hat{H}|^4)}_{\text{Invariant under } \mathbb{Z}_2 \text{ but breaks } SU(4)} - \underbrace{\sigma f_0^2 |H|^2}_{\text{Softly breaks both } \mathbb{Z}_2 / SU(4)} + \underbrace{\rho |H|^4}_{\text{Hardly breaks } \mathbb{Z}_2 / SU(4)}$$

Invariant under  $\mathbb{Z}_2$  and  $SU(4)$  symmetries, and sources the spontaneous symmetry breaking.

Invariant under  $\mathbb{Z}_2$  but breaks  $SU(4)$  symmetry explicitly. This generates SM Higgs VEV,  

$$v = \hat{v} = \frac{f_0}{\sqrt{(2\lambda + \kappa)}}$$

Softly breaks both  $\mathbb{Z}_2 / SU(4)$  symmetries. It generates misalignment in the two VEVs  

$$v \leq \hat{v}$$

Hardly breaks  $\mathbb{Z}_2 / SU(4)$  symmetries. It introduces misalignment and potentially reduces fine-tuning.

$$H = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + h_0 \end{pmatrix}, \quad \hat{H} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ \hat{v} + \hat{h}_0 \end{pmatrix}$$

# TWIN HIGGS PHYSICAL BASIS

- ◆ Twin Higgs effective potential has 5 parameters

$$V_{\text{eff}}(H, \hat{H}) = \lambda \left( |H|^2 + |\hat{H}|^2 - \frac{f_0^2}{2} \right)^2 + \kappa (|H|^4 + |\hat{H}|^4) - \sigma f_0^2 |H|^2 + \rho |H|^4$$

- ◆ Twin Higgs physical basis

$$\underbrace{f_0, \lambda, \kappa, \sigma, \rho}_{\text{TH gauge basis}} \longleftrightarrow \underbrace{v, f, m_h, m_{\hat{h}}, \tilde{\rho}}_{\text{TH physical basis}}$$

- ◆ SM Higgs mass  $m_h = 125 \text{ GeV}$  and SM vev  $v = 246 \text{ GeV}$  are fixed.
- ◆ Twin Higgs mass  $m_{\hat{h}}$  and twin vev  $f \equiv \sqrt{v^2 + \hat{v}^2}$  are free parameter, along with hard breaking term

$$|\tilde{\rho}| \equiv \left| \frac{\rho}{\lambda} \right| < 1$$

# MIRROR TWIN HIGGS

Chacko, Goh, Harnik: hep-ph/0506256

SM sector

MTH sector

$$SU(3) \times SU(2) \times U(1)$$

$$\widehat{SU}(3) \times \widehat{SU}(2) \times \widehat{U}(1)$$

$$\hat{t}$$

$$\hat{h}$$

$$\hat{W}^{\pm}, \hat{Z}$$

$$t$$

$$h$$

$$W^{\pm}, Z$$

$$b, c, \tau, \mu, \dots$$

$$\gamma, g$$

$$\hat{b}, \hat{c}, \hat{\tau}, \hat{\mu}, \dots$$

$$\hat{\gamma}, \hat{g}$$

Twin sector is an exact copy of SM.

$$\hat{m}_{\text{twin}} = \frac{\hat{v}}{v} m_{\text{SM}} \simeq \frac{f}{v} m_{\text{SM}}$$

# TWIN HIGGS PHENOMENOLOGY

- ◆ Twin Higgs (radial mode) decays dominantly into SM and twin sector gauge bosons, and to the SM Higgs.
- ◆ Prediction for the twin Higgs branching fractions (due to Goldstone boson equivalence theorem)

$$\begin{aligned} \mathcal{B}(\hat{h} \rightarrow hh) &\simeq \mathcal{B}(\hat{h} \rightarrow ZZ) \simeq \frac{1}{2} \mathcal{B}(\hat{h} \rightarrow WW) \\ &\simeq \mathcal{B}(\hat{h} \rightarrow \hat{Z}\hat{Z}) \simeq \frac{1}{2} \mathcal{B}(\hat{h} \rightarrow \hat{W}\hat{W}) \end{aligned}$$

$$\mathcal{B}(\hat{h} \rightarrow \text{SM}) \simeq \frac{4}{7}, \quad \mathcal{B}(\hat{h} \rightarrow \text{inv.}) \simeq \frac{3}{7}$$

# TWIN HIGGS PHENOMENOLOGY

- ★ In the presence of  $\mathbb{Z}_2$  hard breaking term  $\tilde{\rho}|H|^4$

- ★ For  $\tilde{\rho} > 0$

$$\mathcal{B}(\hat{h} \rightarrow VV) > \mathcal{B}(\hat{h} \rightarrow \hat{V}\hat{V})$$

$$\mathcal{B}(\hat{h} \rightarrow VV) \approx \mathcal{B}(\hat{h} \rightarrow hh)$$

# TWIN HIGGS PHENOMENOLOGY

MTH,  $\tilde{\rho}=0$ ,  $\Lambda=5$  TeV

★Contours of twin Higgs cross-sections to SM gauge bosons at the LHC with  $\sqrt{s}=14$  TeV

$$\sigma_{\hat{h} \rightarrow ZZ}^{ggF} \equiv \sigma(gg \rightarrow \hat{h}) \cdot \mathcal{B}(\hat{h} \rightarrow ZZ)$$

★Contours of Higgs signal strength

$$\mu_{h \rightarrow ZZ}^{ggF} \equiv \frac{\sigma(gg \rightarrow h) \cdot \mathcal{B}(h \rightarrow ZZ)}{\sigma^{\text{SM}}(gg \rightarrow h) \cdot \mathcal{B}^{\text{SM}}(h \rightarrow ZZ)}$$

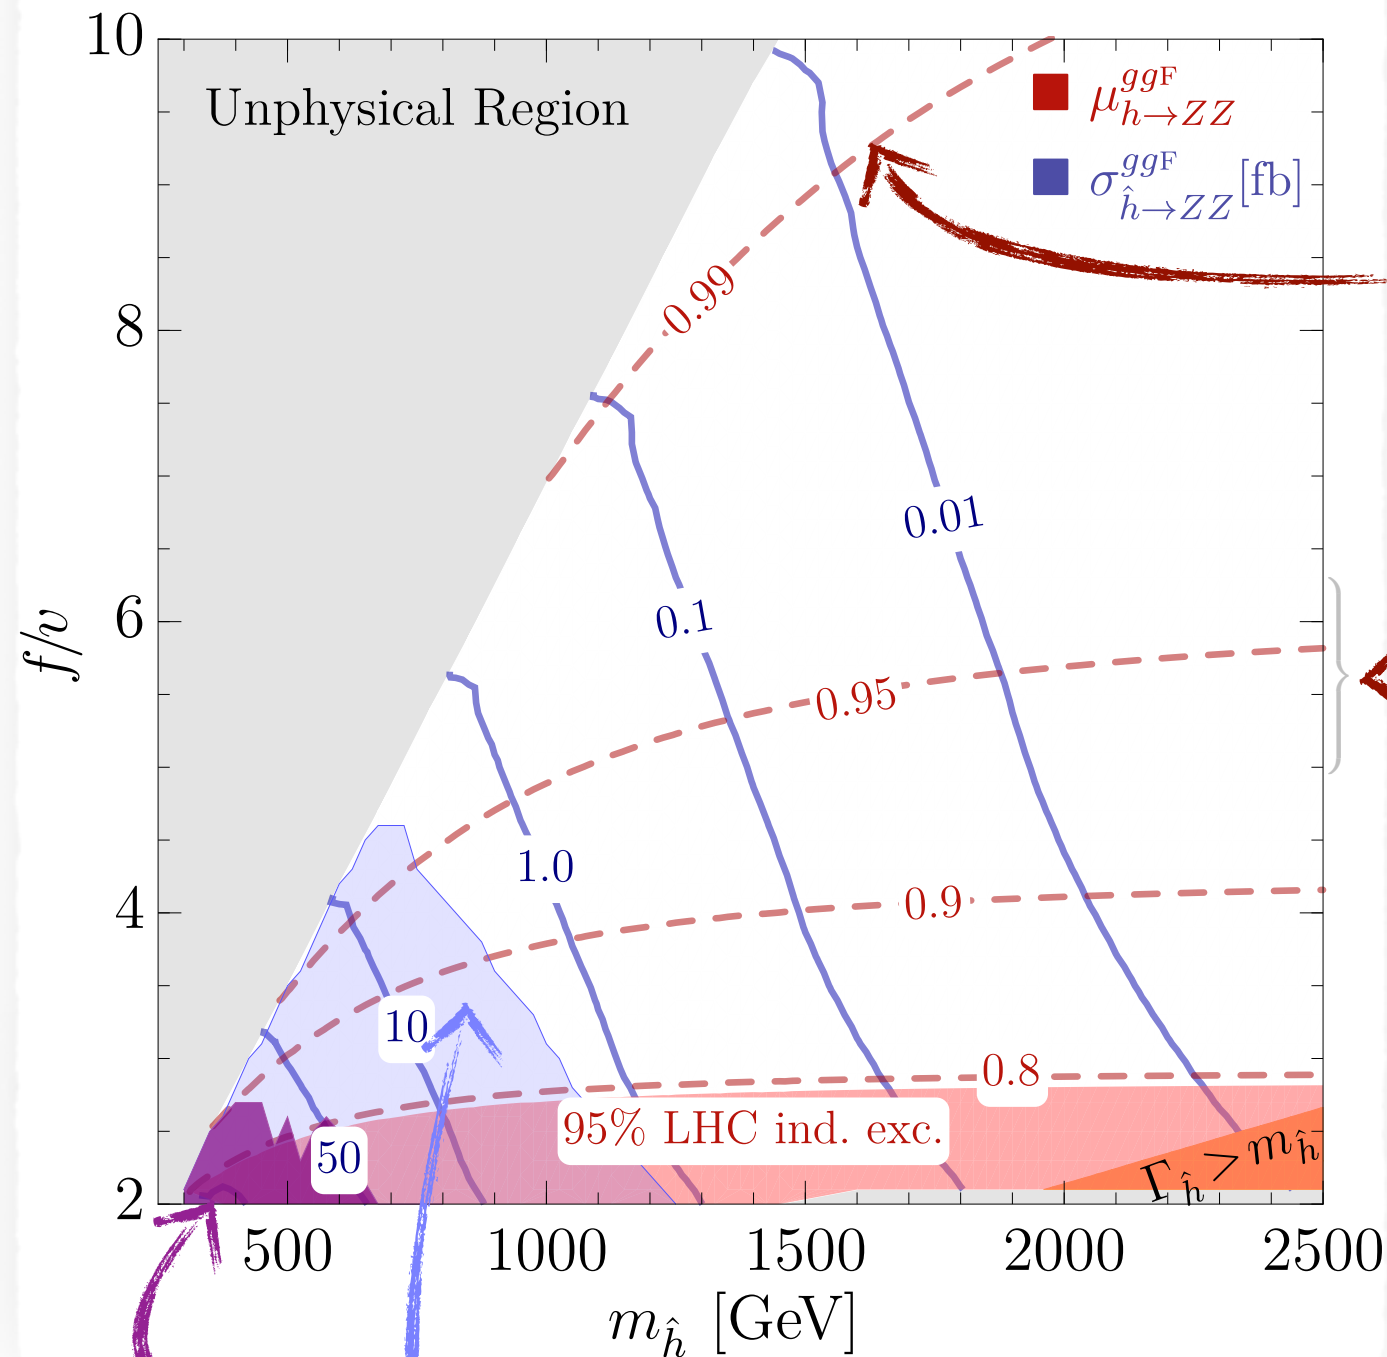

# TWIN HIGGS PHENOMENOLOGY

MTH,  $\tilde{\rho}=0$ ,  $\Lambda=5$  TeV

see also Z. Chacko and S. Najjari's talks

Buttazzo, Sala, Tesi: 1505.05488

Chacko, Kilic, Najjari, Verhaaren: 1711.05300

ILC can reach sensitivity of Higgs signal strength measurements up to 1~2 %.

HL-LHC will reach sensitivity of Higgs signal strength measurements up to 4~8 %.

Excluded by ATLAS @ 95% C.L.

HL-LHC projected reach @ 95% C.L.

Heavy Higgs searches

# TWIN HIGGS PHENOMENOLOGY

MTH,  $\tilde{\rho}=0$ ,  $\Lambda=5$  TeV

MTH,  $\tilde{\rho}=0.5$ ,  $\Lambda=5$  TeV

★ For explicit  $\mathbb{Z}_2$  hard breaking parameter  $\tilde{\rho} > 0$ , the twin Higgs rates to the SM states increase, hence larger parameter space can be probed at the LHC.

# FRATERNAL TWIN HIGGS

Craig, Katz, Strassler, Sundrum: 1501.05310

SM sector

$$SU(3) \times SU(2) \times U(1)$$

FTH sector

$$\widehat{SU}(3) \times \widehat{SU}(2)$$

FTH require minimal twin sector particles to cancel radiative corrections.

★ No light twin quarks, implies large twin QCD confinement scale.

★ Light twin hadrons are twin glueball/bottomonium states.

★  $\hat{O}^{++}$  twin hadrons mix with the SM Higgs, implies exotic decays!

# TWIN HADRON PHENOMENOLOGY

- ◆ Twin hadrons (glueball) are produced via SM Higgs and twin Higgs

- ◆ Twin hadron production via heavy Higgs
- ★ Large hadronic multiplicities
- ★ heavy twin hadron states accessible
- ◆ Lightest twin glueball  $\hat{G}_{0+}$

$$m_{\hat{0}+} \simeq 6.8 \hat{\Lambda}_{\text{QCD}}$$

# TWIN HADRON PHENOMENOLOGY

- ♦  $\hat{0}^{++}$  twin glueball mix with the Higgs and decays to SM light fermions with displaced vertices.

★ decay-length  $c\tau_{\hat{0}} \lesssim 10$  m is accessible at the LHC.

★ glueball cross-sections via twin Higgs are comparable to that of SM gauge bosons

$$\sigma_{\hat{h} \rightarrow \hat{G}_{0+}}^{ggF} \approx \sigma_{\hat{h} \rightarrow ZZ}^{ggF}$$

This makes a strong case to discover Twin Higgs at the LHC

$$(m_{\hat{0}^+}, m_{\hat{b}}) = (25, 75) \text{ GeV}, \tilde{\rho} = 0, \Lambda = 5 \text{ TeV}$$

# CONCLUSIONS

- ◆ Twin Higgs Models are the prime illustration of “Neutral Naturalness”.
- ◆ Scalar sector of the Twin Higgs model provides a portal between the visible (SM) and dark (Twin) sectors.
- ◆ Twin Higgs mechanism can be discovered by measuring the mass and VEV of the heavy twin Higgs, along with its predicted rates to SM.
- ◆ Fraternal Twin Higgs model gives novel discovery potential via the exotic decays of twin hadrons to the SM light fermions.
- ◆ HL-LHC and the future colliders have the potential to discover (or refute) the twin Higgs mechanism.
